1. Sketches

The sketches below show the initial designs for the website. Because the scope is still very small, there are not lots of screens and it is possible that in the future we will expand for more features that will also need to have their own sketch phase.

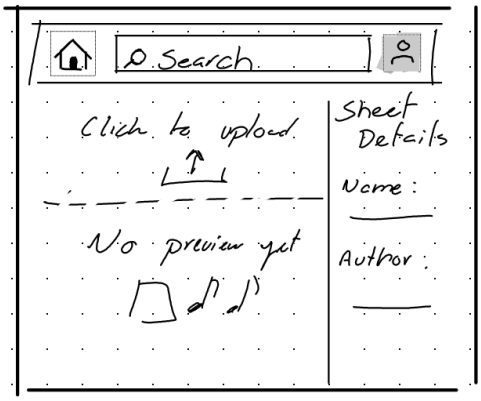

Home Page

- Should be easy to look at
- have controls for all features
- Show sheets (main feature)
- Data should show views, likes, rating

Sheet Menu

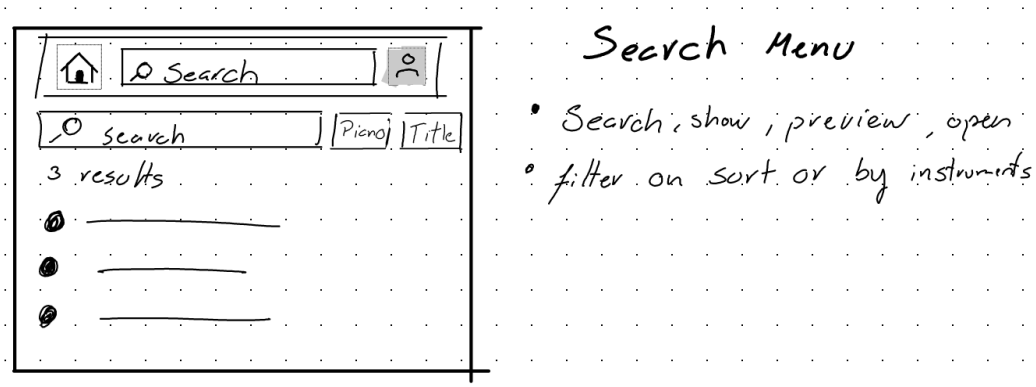

- Show sheet
- Allow play and pause
- Parts show all parts that compose a sheet
- Allow to filter music per part (s)
- Download part or whole set

Upload Menu

- User can preview before uploading
- Allow change song data
  - → title
  - → Author
  - → Description
  - → parts

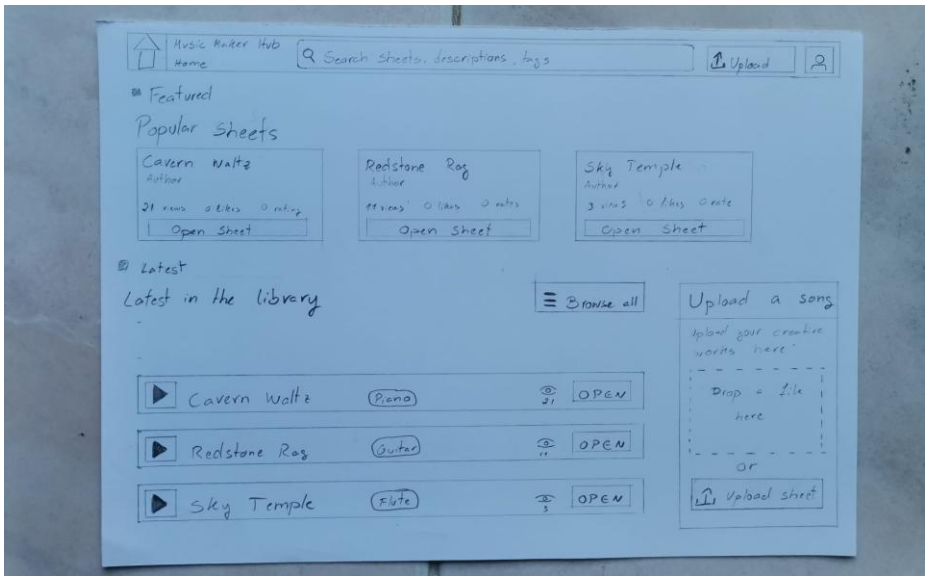

These first images show 3 of the 4 existing screens: Home Page, where the user is first welcomed. The idea is to show in a simple and effective way all the possible tasks he can do: search, preview, open, upload. The second image shows the Sheet menu where the user can see in more detail the sheet information and composition, the different instrument parts, he can play, pause, seek and download it. The third image is the Upload menu which allows a user to upload their own works. This menu should allow a user to upload their work, have a local preview of what they did before sending it to the server, and edit any information regarding the selected music sheet.

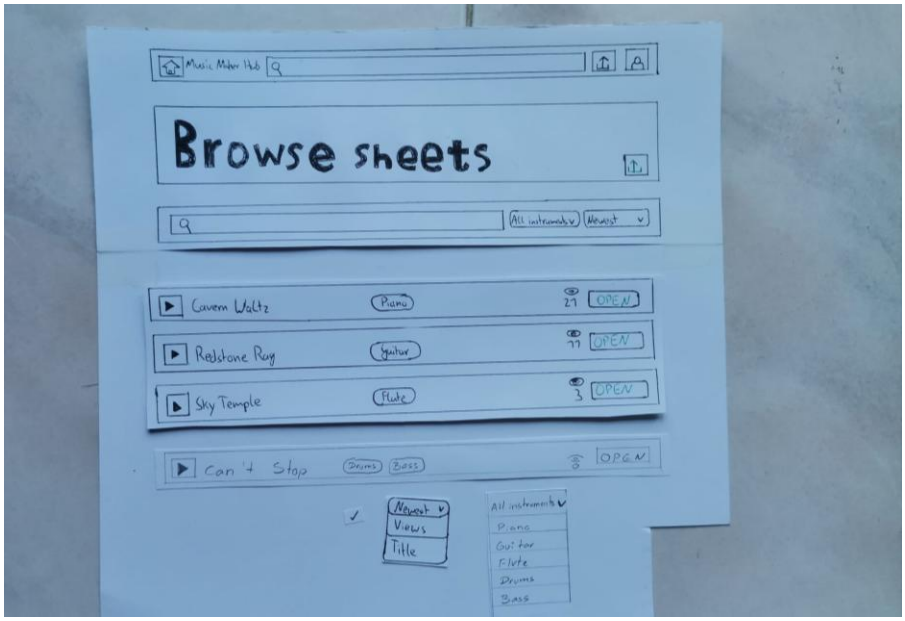

This image is the last predicted menu for the app: the Search menu which allows users to search for any sheets they want based on title, description, parts and instruments. This search can also be filtered by Instruments or Sorted by some metrics (Tile, Newest, Popular, etc).

2. Prototype Photos

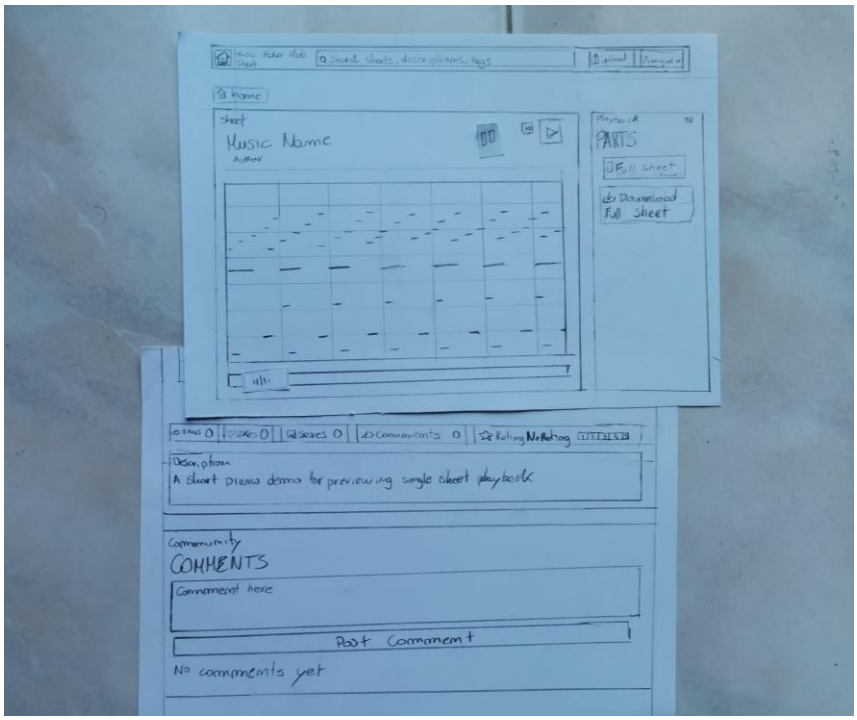

Below are some photos of the paper prototypes with the dynamic elements for each menu. Each photo shows all the paper pages for each type of menu

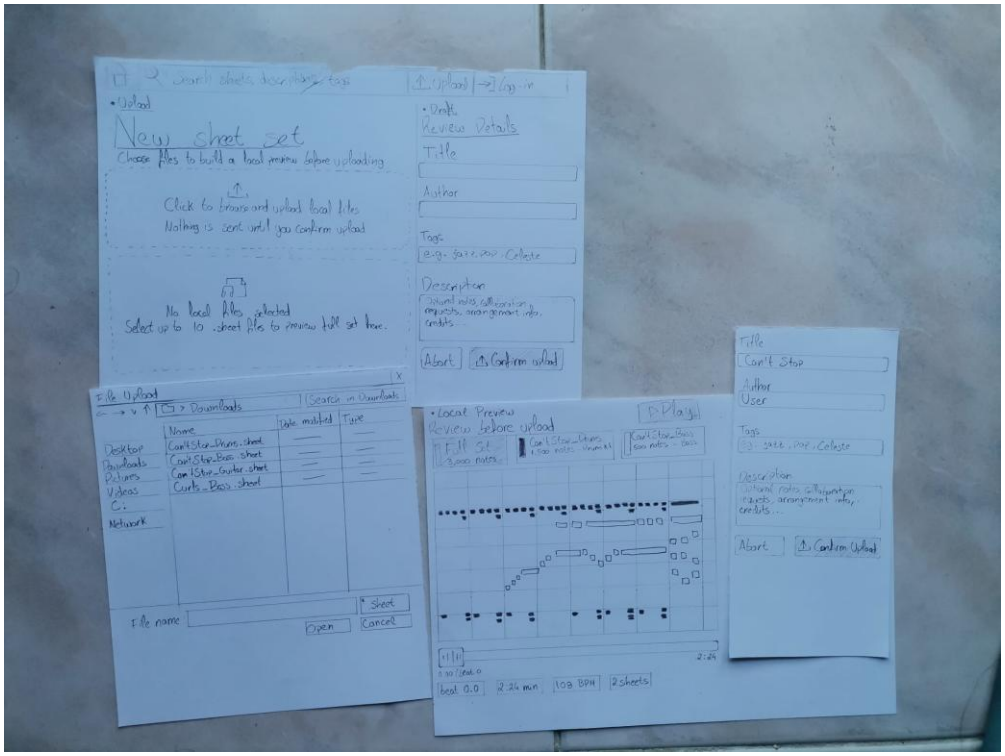

First image shows the Home Page with the desired features: Simple and intuitive interface, with a button to reach every feature currently available: Search, Upload, Preview, Open. There is a gap on the “Latest in the library” section to account for a possible existing scenario in which the user uploaded a music sheet and, given that it is the latest addition, it needs to be added to the list.

Search Sheet menu, or named “Browse Sheets” in the prototype, allows users to search the sheet, it shows available results, Views and Instruments. A user can preview and open them, he can search for music sheets using relevant criteria and he can sort or filter to whatever existing filters exist.

Sheet Menu opens a sheet, allows a user to play, pause and seek. On the right there is a panel to select the existing parts to either single them out during playback or only to download specific parts. Below there is another section with an extension to the screen which shows sheet data such as views, likes, saves, ratings, comments (these are meant to mimic how a social media looks, as in, have the same features), description, and followed by comments underneath

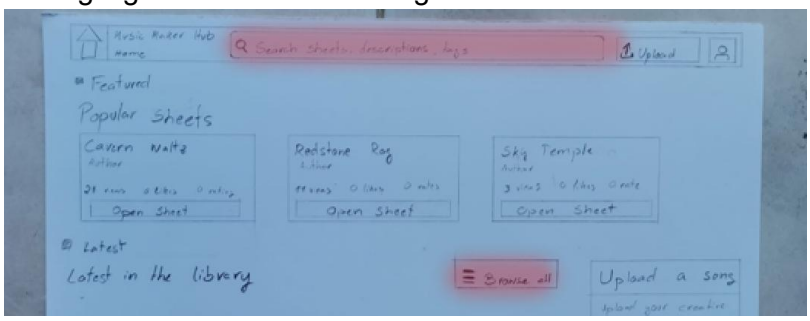

Above is the Upload Menu which has slightly more screens than the rest. The first, at the top, shows the first look at the Upload page when nothing has happened: in the middle we have a sign telling the user to click to upload his work, followed by a preview section below (or nothing if nothing has been selected). On the right there is a panel with editable sheet details. Below this page is a small pop-up window to mimic a windows pop-up of the File Explorer in which the user can see the available files to choose from (*.sheet* files). Upon selecting these, we move to the final two screens on the right which show the preview for the chosen files, as well as a pre-filled detail screen based on the chosen files data. The user can then upload his work on the somewhat big and colored “Confirm Upload” button.

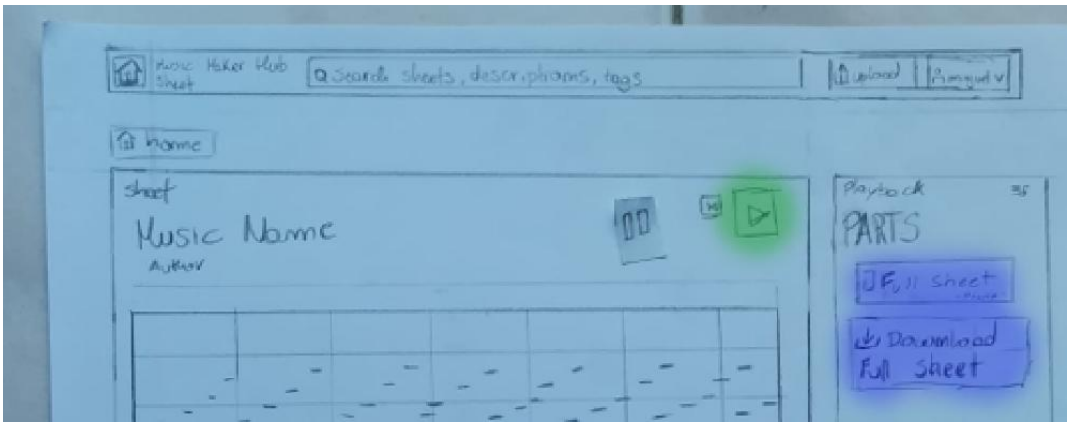

2.1 Storyboards

We will focus on the task’s interactions based on the scenarios (because the scenarios were meant to cover most, if not all the possible existing scenarios)

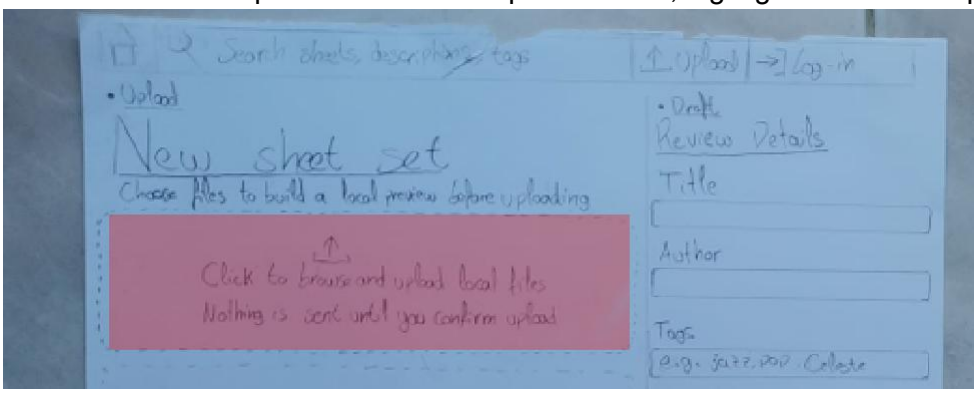

1. Search, open, play and download a sheet.
   To search for a music sheet, there are two available buttons at the Home Page which are highlighted in red in the image below

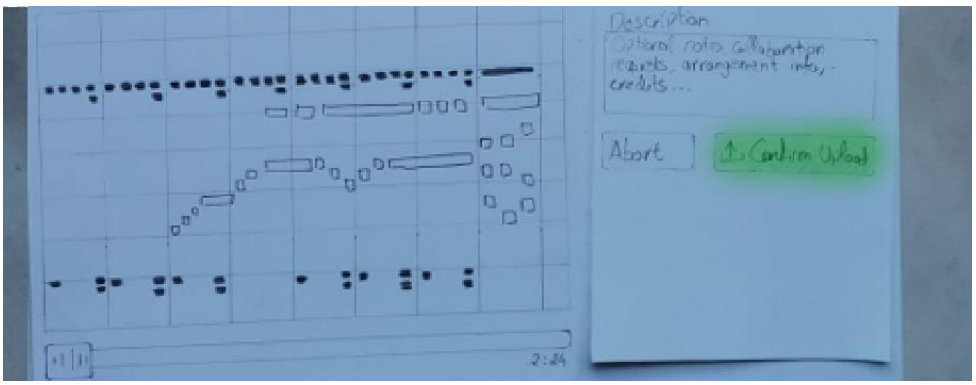

Upon selecting any of these buttons, the user goes to the Search Menu page, in which the user can search, filter or sort through anything he wants. Then, upon opening a sheet, the Sheet Menu appears. He can press the highlighted green button to play music, or pause, if already playing. On the right, highlighted in blue, there are the button to select a part and download it.

2. Upload a sheet
   The user first must press the Click to Upload button, highlighted in red to upload files

   Pressing it opens the Windows pop-up screen for the File Explorer, in which the user can select whichever *.sheet* files he has. Selecting and opening the files will show a preview of the song he chose, with new details on the right panel with a tile and author already pre-filled. This preview, like a sheet on the Sheet menu, can be listened to. Pressing the green highlighted Confirm Upload button will upload his work.

3. Social interactions
   For the scenarios we only considered interactions for Liking a sheet and leaving a comment. To start off, the user needs to have a sheet open to perform any of these

actions. With a sheet open, the user may Like and comment by pressing the buttons highlighted in red (a comment cannot be blank, so it also needs to be typed out).

3. Briefing

The briefing was a simple explanation of the topic and why it felt important. It also tried to bond with the user given that most test users we had have most likely already played Minecraft or used mods (modifier files to change the experience of the game).

“This is a website for a Minecraft mod called Music Maker Mod. You most likely have heard of Minecraft and played it yourself, and you probably have used mods for it. The mod in question here is called Music Maker mod which allows players to create, play and share music made inside Minecraft. The current issue is that there is no organized way to share files and it is hard to preview them. This website attempts to better organize and search music files, allow for easy preview, download and enable better community interactions”

4. Scenario Design

Scenario 1: Finding a part for rehearsal

Sofia needs a piano part for a Minecraft server performance that evening.

She searches the library for sheets containing **piano**, listens to a result, and opens it. She selects the full set, then downloads the *.sheet* file for the mod.

Scenario 2: Publishing an arrangement

Rui has made a **drums-and-bass** arrangement. He goes to upload his work.

He selects both *.sheet* files and listens to the local preview before uploading. He adds a title and author and confirms the upload. After a while, the arrangement is published on the website.

Scenario 3: Taking part in the community

Inês opens a sheet that a friend shared with her. She likes it and leaves a comment showing her appreciation for the score.

5. Observations

After performing the scenarios with many test users, we received positive feedback from all users, and they all agreed that the interface was simple and easy to use. All scenarios were done under the time limit and users managed to finish them without a lot of doubts.

There was only 1 concern raised by one user: on the Upload Screen, we have the Confirm Upload button set to the right and Abort button on the left, and he argued that it should be the other way around.

After reviewing different UX conventions we found that there is no universally correct ordering for confirmation and cancellation buttons. Since our interface follows a common web-dialog convention, we decided to keep the primary action “Confirm Upload”, on the right and the secondary action on the left, with the primary action visually emphasized. We also realized that it’d be better to rename “Abort” to “Cancel” to make the button’s purpose clearer. This maintains consistency with our intended interface design while addressing the terminology used in the upload process.
